Charge Yourself with SUBTLE ENERGY

Short introduction

I think we have all heard of the phrase of mystical or subtle energy for the Orgone energy, Chi energy or any other undefined types of energy. Some people like to call them „Life energy“ or „Spiritual energy“. Maybe these last two fall into the same category or they are an independent form that are also mystical to us. A good novelist friend of mine Dušan Ninić used to say: “What never happened, will never happen, but always existed.”

Usually, such energy cannot be calculated with known methods, even if there is, it would be debatable on how they made the calculations.

All of this are just problems that restrain us from being sure if subtle energy exists, if we study and expand the techniques for their use and which is most important, having a high percent repeatability.

I have been professionally researching energy production since 1999 and how they apply different areas in physics such as electromagnetism, electrochemistry, solar energy etc. During all those experiments, I have experienced a few very odd things that I've had difficulties explaining or repeating.

At the same time, I have noticed that in conditions of high frequencies, high voltage and other powerful fields of physics, the frequency and of intensity of the subtle energy were growing and lasted longer. I liked calling them “Half paranormal occurrences.”

Here's an interesting example. During 2006 and 2007 I have been intensively experimenting with Tesla Coils. At one point I forgot to remove the nearby condenser with which I collected radiant energy from the Tesla Coil.

That capacitor was there for days, and I heard a sizzling sound coming out of it. Then I realized that I forgot about it and that sound was caused by overstraining the isolator within. It gave me a clue that the current in that capacitor was 2000 volts. When I tried to empty it, it came to an explosive discharge. From experience I know in those situations the capacitor does not empty up completely and I wanted to measure how charged it was. I realized somehow the capacitor became twisted which is not possible and attributed that to shock after the explosive discharge. When I tried to measure the current in the capacitor, a light blueish mass like the HV corona was moving from the capacitor on my hand. And the same light bluish mass was crawling from my hands to my elbows. In panic I swiped the mass off with my hands and it was gone.

After that I stopped my research and tried to recreate the same effect. Unfortunately, I was not successful.

Another interesting example is during one of my trips to China, we had a presentation in R&D department, a well-known Chinese manufacturer. During the presentation my business partner's laptop stopped working. He still carried on with the presentation, but he was visibly nervous because a lot of important data was on that laptop. While he was presenting, I asked him to give me the laptop. I haven't even tried to start the machine I just layer my right palm on it and listened to the presentation. After a few minutes I felt something strange under my palm, as if there as an energy flow between my hand and the laptop.

When I had the feeling that the flow has ended, I've opened the laptop and pressed the power button. You guessed it, the laptop started working again. My business partner who always tried to leave an impression as a serious and focused spokesperson, could not believe what had happened, stopped his presentation to ask: "How did you do that?!" To which jokingly I replied: "Chi energy". That joke was well received by our Chinese audience.

We all have a lot of these types of stories, and it happened to everyone, some people pay attention, some ignore it.

What is subtle energy

It's not easy defining subtle energy or even if they exist. What I would like to say is that what we call subtle energy is energy extremely small intensity and it's effect on objects around us or we are a very small intensity in a unit of time. The whole concept of energy is it's change in intensity and that's how it manifests.

We usually focus and react to intensive and relatively quick changes, but there are very slow changes that we cannot detect. An example is infra sound, we cannot hear them, but it can affect us in high frequencies that we also cannot hear. Another example changes in temperature of our surroundings or bad weather which some people can feel.

Now here's one of my examples from January 2010 when I experimented with a new type of electromotor I constructed. I fed it with a single AA battery. For this experiment I deliberately use an old non rechargeable battery which was empty and haven't been used in years, meaning the battery lost his capacity ages ago before that.

When I started the experiment the voltage of the battery was overstressed and was around 0.35V instead of 1.5V.

The whole experiment lasted around a week, 24 hours a day.
